成果名称	Environmental degradation and sustainable development of economies: empirical evidence on economic performance.
成果完成单位	西京学院
完成人	Fahmida Laghari （法米达）
成果简介	<p>The present paper aims to analyze the influence of environmental practices over the sustainable development of economies which create economic resilience for the economies classified according to different income levels. The authors aim to assess the impact of high environmental degradation (HED) on GDP growth volatility and GDP growth for economies over the long term and short term for the period of 1955–2020 in 124 countries. The findings of empirical analysis conclude that HED economies will have high growth in the long term than their counterparts. The economies of HED have a significant mean difference in volatility with their counterpart control group that implies HED economies have low volatility than the control group. Economies with HED have higher financial development relative to their control economies. The empirical analysis of robustness checks shows that economies with HED have low volatility in GDP and higher growth rates. HED economies enjoy high and sustainable financial development and high gross fixed capital formation, which signifies a high level of investment in their economy than their control counterpart.</p>
